╔═══════════════════════════════════════════════╗
║   📡  MARKET INTEL — LIVE MACRO BRIEFING       ║
╚═══════════════════════════════════════════════╝
```

2 major events landing in the next 6 hours.
Combined risk state: CAUTION — see operational read below.

📘 **EXPANDED TERMINOLOGY HYPERLINKS**

```
CPI]  Central Bank]  Hawkish]  Dovish]  Risk-On / Risk-Off]  Yield Spread]
```

```
╔═══════════════════════════════════════════════╗
║   🌐  GLOBAL MARKET MOOD  &  RISK STATE        ║
╚═══════════════════════════════════════════════╝
```

```
▸  Risk State  ·  CAUTION  🟠🟠🟠🟠  (4 / 5)
```

What it means right now:
Markets are sensitive. A mid-week US CPI print at 12:30 UTC
plus an ECB speaker at 14:00 UTC are converging into a

24-hour window where surprises can move dollar pairs, gold, and US indices in a coordinated way.

What this means for trader behaviour:
🟢 Pre-event: keep position sizes light. Big news = big swings.
🟡 During: do not chase the first 60 seconds of the print.
🟠 After: wait for the 5m close to confirm direction.
🛑 If both events surprise the same way: tactical stand-aside.

Why this rating, not lower or higher:
Risk would be RED (5/5) if a central-bank decision were landing this cycle — there isn't. Risk would be YELLOW (3/5) if only one of these two events were on the calendar.

```
╔══════════════════════════════════════════════╗
║   📅  MAJOR EVENTS  ·  NEXT 24 HOURS          ║
╚══════════════════════════════════════════════╝
```

```
12:30 UTC   US CPI (inflation print)          🟠🟠🟠🟠  HIGH
14:00 UTC   ECB Lagarde — scheduled speech     🟡🟡🟡    MEDIUM
21:00 UTC   FOMC Daly — fireside chat          🟡🟡      LOW-MEDIUM
```

```
▸  Why these events matter
```

CPI is the inflation print that decides whether the Fed stays on its current path or tightens further. A hot print pushes the dollar up and pressures equities and gold. A soft print does the opposite. Lagarde's speech follows the print and often re-prices the euro relative to dollar moves.

ATLAS · Market Intel

```
- 🆕  PRIMARY EVENT  ·  US CPI · 12:30 UTC
```

🇺🇸 · US CPI · April release · 🟠 HIGH

US Consumer Price Index for April. Headline + Core readings determine whether the Fed leans hawkish or dovish at the next meeting. The print moves dollar pairs, gold, and US indices on release.

WHEN

Today · 12:30 UTC

IMPACT

🟠 HIGH · tier-1 catalyst

AFFECTED MARKETS

DXY · EURUSD · GBPUSD · USDJPY ·
XAUUSD · US500 · NDX

WHAT TRADERS SHOULD WATCH

🟢 BEFORE — Cut size to 30–50% of normal. Step away from open trades 5 minutes before 12:30. Cancel pending limit orders.
🟡 DURING — Do not act on the first 60 seconds of the candle. The initial spike often reverses before settling.
🟠 AFTER — Wait for the 5-minute close after 12:30. Re-read structure once volatility settles. Only act on cleaned-up levels.

ATLAS · Market Intel

```
- 🆕  REACTION PATHS  ·  WHAT HAPPENS IF…
```

```
╔════════════════════════════════════════╗
║   🎯  POSSIBLE MARKET REACTION PATHS    ║
╚════════════════════════════════════════╝
```

```
Hawkish Surprise]  Dovish Surprise]  In-Line Print]  Whipsaw]
```

```
▸  IF  CPI prints HOTTER than expected (hawkish)
```

• Dollar (DXY) pushes higher.
• EURUSD / GBPUSD pressured to the downside.
• US indices (US500 / NDX) drop on rate-hike fears.
• Gold (XAUUSD) initially drops, can recover on safe-haven flow.
Trader read: short-dollar setups are at risk. Long dollar setups gain weight, but wait for the 5m close.

```
▸  IF  CPI prints COOLER than expected (dovish)
```

• Dollar (DXY) pulls back.
• EURUSD / GBPUSD push up.
• US indices rally on rate-cut optimism.
• Gold rises with the broader risk-on flow.
Trader read: short-dollar setups gain weight. Long-dollar setups should be exited or paused.

```
▸  IF  CPI prints IN-LINE with expectations
```

• Initial spike then settle. No clean directional bias.
• Markets re-focus on Lagarde at 14:00 UTC.
Trader read: stand aside through the spike. Wait for Lagarde.

```
▸  IF  the print sparks a WHIPSAW (both sides print quickly)
```

• Initial direction reverses within 10 minutes.
• This happens 1 in 4 CPI prints, more in high-volatility regimes.
Trader read: do not chase the first move. Wait for the 15m close.

```
- 🆕  RISK ESCALATION  ·  CAUTION ZONES
```

```
╔══════════════════════════════════════════════════════════════════╗
║   ⚠  RISK ESCALATION  ·  CAUTION → DANGER → STAND ASIDE║
╚══════════════════════════════════════════════════════════════════╝
```

```
Risk Escalation]  Stand Aside]  Position Sizing]  Volatility Window]
```

```
🟢 HEALTHY  ·  Pre-print window (now → 12:25 UTC)
   Normal trade-management rules apply. Size light, set sensible
   stops, do not enter fresh positions within 5 minutes of CPI.

🟡 CAUTION  ·  T-5 minutes (12:25 → 12:30 UTC)
   Close open positions in DXY / EURUSD / XAUUSD / US500
   unless they are far in profit and have wide stops.
   Action: tighten stops or step aside.

🟠 DANGER  ·  T-0 to T+5 (12:30 → 12:35 UTC)
   The print moment. Markets often whipsaw 50–100 pips on DXY
   pairs in the first 60 seconds. Do not trade this window.
   Action: stand aside. Watch only.

🛑 STAND ASIDE  ·  If both CPI and Lagarde surprise hawkish
   Combined surprise from both events would re-price the dollar
   for the rest of the session. Wait for the 15-minute close
   AFTER Lagarde finishes (~14:30 UTC) before resuming.

🟢 RE-ENTRY  ·  12:35 UTC onwards
   Re-read structure on the 5m chart. Match against the
   reaction-path scenarios above. Act only on the cleanest
   setups that match the actual direction the market chose.
```

```
▸  What changes this risk state
```

• If CPI cancels (rare): state drops to YELLOW.
• If a central-bank decision is added: state climbs to RED.
• If Lagarde's speech is cancelled: state drops to YELLOW.

ATLAS · Market Intel

```
- 🆕  WHAT TRADERS SHOULD WATCH  ·  PRE / DURING / POST
```

```
╔══════════════════════════════════════════════════╗
║   👀  WHAT TRADERS SHOULD WATCH                  ║
╚══════════════════════════════════════════════════╝
```

```
DXY]  Yield Spread]  VIX]  Liquidity]
```

```
▸  Pre-event indicators (now → 12:25 UTC)
```

- DXY trend: above 105 = market already pricing hawkish CPI.
- 2Y yield: above 4.85% = same signal.
- VIX above 18 = elevated nerves; below 14 = complacent.
- EURUSD position into the print = market lean.

```
▸  During the event (12:30 → 12:35 UTC)
```

- Initial print reaction in the first 60 seconds is noise.
- Watch the 5m candle close at 12:35 UTC — that's the trend.
- Read DXY first, then look at EURUSD / XAUUSD response.

```
▸  Post-event reassessment (12:35 → 14:00 UTC)
```

- Did the initial direction hold or whipsaw?
- Is volume confirming the move or fading?
- What did treasuries do? (Bonds confirm rate-path bets.)
- Wait for Lagarde 14:00 UTC before sizing into new trades.

📚 EVENT-DAY REFERENCE · THE 4 WINDOWS

```
▲ activity
|                     ┌──────────────┐
|   pre-event        /  T-0 print     \    post-settle
|     ✓             /     ⚠ chaos      \     ✓ trade
|   ─────────────── / ──────────────────\ ─────────
|                 /                       \
└──────────────────────────────────────────────────▶ time

     T-5        T+0     T+5       T+15      T+30
```

▸ **How to read this**

Every macro event has 4 windows. Pre-event = trade with size light. T-0 = stand aside. Post-settle (T+5 to T+15) = the real direction shows up. T+30+ = normal trading.

▸ **How a trader uses this**

Look at the clock against the event time on the schedule above. Match the window to the rule. Position sizing and entry timing follow from the window, not the chart alone.

▸ **Rendered ATLAS event cards coming next**

Future scans will replace this schematic with rendered ATLAS event cards — actual price charts during real CPI prints, with the four windows annotated on live data.

▸ **Briefing summary**

Two macro events land within 90 minutes today. Risk state is
CAUTION (4 / 5) for the next 6 hours. Reduce position sizing,
avoid the T-0 print windows, and re-read structure AFTER the
5-minute close on each event. ATLAS Market Intel next updates
at 13:30 UTC with the post-CPI read.
