╚══════════════════════════════════════════════════╝
```

```
▸  Risk State  ·  🟠🟠🟠🟠⚫ 3/5 — Active
```

What **Market Mood** means right now:
A single high-impact catalyst is in the window: CPI (USD) at 15:55 AWST · 07:55 UTC.
Concentrated 30-minute risk envelope around the release.

What this means for trader behaviour today (dollars-first):
🟢 Pre-event window — If your normal risk per trade is $500 on a
$10,000 account, reduce to ~$300 (60% of normal) for the
next 6 hours. Why: bigger market swings mean wider exit-points
are needed, which means more $$$ at risk per setup.
🟡 During CPI (USD) (07:55 UTC → T+5) — do NOT trade. Do NOT add
to open positions. The first 60 seconds after the **announced
result** routinely moves $500–$1,000 against any position
on a standard $100k EURUSD lot.
🟠 After CPI (USD) (T+5 → next catalyst) — wait for the 5-min candle close
at T+5 to read direction. Then re-size, still at 60% of

normal until the next scheduled catalyst delivers.
🛑 If multiple clustered events ALL surprise on the hawkish side:
stand aside entirely for the rest of the session.

Why this rating, not lower or higher:
Rating would be 🟠🟠🟠🟠⚫ 4/5 — ELEVATED if a second high-impact catalyst joined the window. Rating would be 🟡🟡⚫⚫⚫ 2/5 — CALM if today were driver-led only.

```
╔══════════════════════════════════════╗
║  📅  MAJOR EVENTS  ·  NEXT 24 HOURS   ║
╚══════════════════════════════════════╝
```

```
07:55 UTC   CPI (USD) (USD)   🟠🟠🟠🟠⚫ 4/5 — HIGH
```

```
▸ Why these events matter (plain English)
```

Hotter-than-forecast readings historically tend to support USD and yields (rates expected to stay higher for longer), pressuring gold and risk indices. Cooler readings favour the reverse rotation.

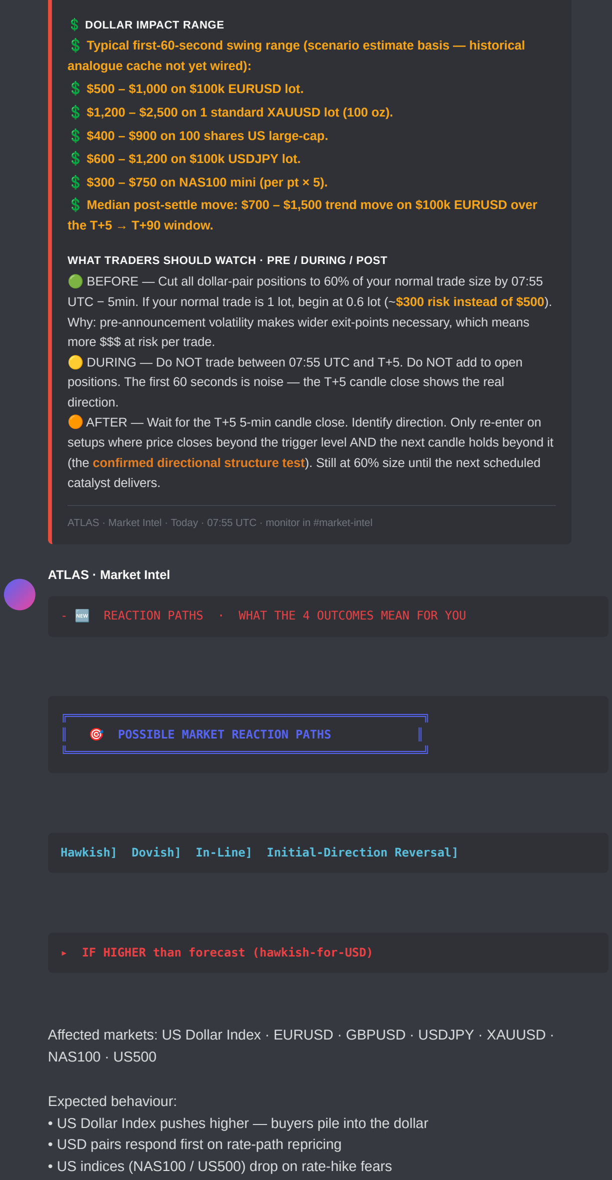
EXPECTED DURATION
Intraday (next 6 hours)

AFFECTED MARKETS
DXY · EURUSD · GBPUSD · USDJPY · USDCAD · USDCHF · AUDUSD · NZDUSD · XAUUSD



💲 **DOLLAR IMPACT RANGE**

💲 **Typical first-60-second swing range (scenario estimate basis — historical analogue cache not yet wired):**

💲 **$500 – $1,000 on $100k EURUSD lot.**

💲 **$1,200 – $2,500 on 1 standard XAUUSD lot (100 oz).**

💲 **$400 – $900 on 100 shares US large-cap.**

💲 **$600 – $1,200 on $100k USDJPY lot.**

💲 **$300 – $750 on NAS100 mini (per pt × 5).**

💲 **Median post-settle move: $700 – $1,500 trend move on $100k EURUSD over the T+5 → T+90 window.**

WHAT TRADERS SHOULD WATCH · PRE / DURING / POST

🟢 BEFORE — Cut all dollar-pair positions to 60% of your normal trade size by 07:55 UTC − 5min. If your normal trade is 1 lot, begin at 0.6 lot (~**$300 risk instead of $500**). Why: pre-announcement volatility makes wider exit-points necessary, which means more $$$ at risk per trade.

🟡 DURING — Do NOT trade between 07:55 UTC and T+5. Do NOT add to open positions. The first 60 seconds is noise — the T+5 candle close shows the real direction.

🟠 AFTER — Wait for the T+5 5-min candle close. Identify direction. Only re-enter on setups where price closes beyond the trigger level AND the next candle holds beyond it (the **confirmed directional structure test**). Still at 60% size until the next scheduled catalyst delivers.

╔════════════════════════════════════════╗
║   🎯 POSSIBLE MARKET REACTION PATHS     ║
╚════════════════════════════════════════╝
```

```
Hawkish]  Dovish]  In-Line]  Initial-Direction Reversal]
```

```
▸ IF HIGHER than forecast (hawkish-for-USD)
```

Affected markets: US Dollar Index · EURUSD · GBPUSD · USDJPY · XAUUSD · NAS100 · US500

Expected behaviour:
- US Dollar Index pushes higher — buyers pile into the dollar
- USD pairs respond first on rate-path repricing
- US indices (NAS100 / US500) drop on rate-hike fears

- Gold initially drops; can recover on safe-haven flow if surprise extreme

💲 Dollar impact (first 30 minutes after the release):
- Long USD positions: **$300 – $800 gain**
- Short USD positions: **$300 – $800 drawdown**
- Long XAUUSD trades: **$500 – $1,500 drawdown**

What you should do:
✘ Do NOT enter fresh positions in the first 5 minutes — chase risk is high
✘ Do NOT add to any positions against the surprise direction
✓ After the 5-min close at T+5, look for SHORT positions in the dominant USD direction using the next Dark Horse scan
✓ Exit losing positions against the surprise direction on the T+5 close if direction holds

`▸ IF LOWER than forecast (dovish-for-USD)`

Affected markets: US Dollar Index · EURUSD · GBPUSD · USDJPY · XAUUSD · NAS100 · US500

Expected behaviour:
- US Dollar Index pulls back — sellers exit dollar longs
- USD pairs reverse on rate-path repricing
- US indices rally on rate-cut optimism
- Gold rises with broader risk-on flow

💲 Dollar impact (first 30 minutes after the release):
- Long USD positions: **$300 – $800 drawdown**
- Short USD positions: **$300 – $800 gain**
- Long XAUUSD trades: **$500 – $1,500 gain**

What you should do:
✘ Do NOT enter fresh positions in the first 5 minutes
✘ Do NOT add to any positions against the surprise direction
✓ After the 5-min close at T+5, look for LONG positions in the dominant opposite-USD direction using the next Dark Horse scan
✓ Exit losing positions against the surprise direction on the T+5 close if direction holds

`▸ IF IN-LINE with forecast / market pricing`

Affected markets: light reaction across the board

Expected behaviour:
- Initial spike either side then settle. No clean directional bias.
- Volatility drops within 15 minutes.
- Markets refocus on the next scheduled catalyst.

💲 Dollar impact (first 30 minutes after the release):
- $100k EURUSD position: $100 – $300 swings then mean-reversion

What you should do:
✘ Do NOT trade the initial spike — it will settle.
✓ Stand aside through T+5. Re-read at next ATLAS scan.
✓ Re-engage normally once the next scheduled catalyst delivers.

```
▸ IF INITIAL-DIRECTION REVERSAL · the first move reverses within 10 minutes
```

Affected markets: US Dollar Index · EURUSD · GBPUSD · USDJPY · XAUUSD · NAS100 · US500

Expected behaviour:
- The first direction off the release is faded by T+10.
- Volume comes IN against the initial move.
- The 15-min close at T+15 is the real trend, not the first 60-second spike.
- Happens roughly 1 in 4 high-impact releases — more often in elevated-volatility regimes.

💲 Dollar impact (first 30 minutes after the release):
- Trades chasing the first 60 seconds (any direction): **$800 – $1,500 drawdown**

What you should do:
✘ Do NOT chase the first move under any circumstance.
✘ Do NOT add to positions on the initial direction inside T+10.
✓ Wait for the 15-min candle close at T+15.
✓ Trade only the post-T+15 direction — that is the actual signal.

```
🟠 DANGER · first-reaction window
   The release moment passed. Markets routinely whip $500 – $1,000 in the fir
   💲 Cost of trading the first 60 seconds: $500 – $1,200 against any positio
   Action: Stand aside. Watch the 5-min candle close. Do NOT trade.

🟡 RE-READ · post-settle direction
   The 5-min candle close shows the real direction. Re-read structure against
   💲 Holding losing positions through T+15 typically costs $400 – $900 on $1
   Action: Re-size at 60% of normal. Trade only confirmed-candle-close direct
```

```
🟢 RE-ENGAGE · resume normal size
   Volatility settles. Resume normal trade-management.
   💲 Per-candle $ exposure returns to ~$100 – $300 per 5m bar.
   Action: Resume normal trading patterns. Continue to honour structure.
```

```
▸ What changes this risk state
```

• If a central-bank rate decision is added: state climbs to 🔴🔴🔴🔴🔴 5/5 — EXTREME.
• If any scheduled high-impact event cancels: state drops one tier.
• If geopolitical risk escalates inside the session: state climbs one tier (safe-haven rotation overrides driver-led tape).
• If yield curve un-flattens beyond 0.60: cyclical rotation re-prices — direction read flips.

```

```
╔══════════════════════════════════════════════════╗
║  👀 WHAT TRADERS SHOULD WATCH (each row carries action)║
╚══════════════════════════════════════════════════╝
```

```
DXY]  Yield Spread]  VIX]  Liquidity]  Hawkish]  Front-End Yields]
```

```
▸ Pre-event indicators (now → T-5)
```

US Dollar Index above 105 — The dollar has ALREADY moved up in anticipation of a hawkish read. Action: do NOT bet on further dollar strength unless the release surprises EVEN HOTTER than expected. The easy long-dollar trade is already priced in.

Front-end yields above 4.85% — The bond market is also already positioned for a hawkish reading. Same as DXY above — be cautious of fresh long-dollar entries.

CBOE Volatility Index above 18 — Traders are nervous about the release. Equity downside risk is elevated. Do NOT take fresh long-equity positions before T-0.

CBOE Volatility Index below 14 — Traders are complacent. A surprise reading will hit harder. Avoid new positions in any market until T+5.

USD pair at the high or low of its 24h range entering T-0 — The market is leaning directionally. A surprise against that leaning causes the BIGGEST whips. Cut size further if the lead pair is at an extreme entering T-0.

```
▸  During the event (T-0 → T+5)
```

The first 60 seconds of price action — It is NOISE. Do not act on it.
Action: Stand aside.

The 5-min candle CLOSE at T+5 — That prints the real direction. Read US Dollar Index first, THEN look at USD / XAUUSD response.
Action: Wait for the close. Read DXY first.

```
▸  Post-event reassessment (T+5 onwards)
```

Did the initial direction HOLD or REVERSE inside 10 minutes? — If reversed: trade only the post-T+15 direction. The initial move was wrong.

Is volume CONFIRMING the move or FADING? — Confirming = sustained large candle bodies in the direction. Fading = candle bodies shrinking — direction is exhausting. Only enter trades when volume is confirming.

What did treasuries do? — Bonds move opposite to yields. If yields jumped, bonds fell — that confirms a HAWKISH read. Trade in line with bonds for the cleanest signal.

Next scheduled catalyst proximity — If another high-impact catalyst is within 2 hours, small size or stand aside through the inter-catalyst window.

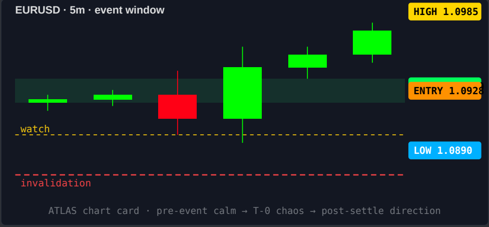
>
> Before the release, candles are small and quiet (pre-event window). At T-0 the candle range explodes — that is the chaos window. By T+5 the noise settles and a clear direction emerges. From T+30 onwards, candles return to normal size and the trend is tradable.



ATLAS chart card · pre-event calm → T-0 chaos → post-settle direction

THE STORY

Before the release, candles are small and quiet (pre-event window). At T-0 the candle range explodes — that is the chaos window. By T+5 the noise settles and a clear direction emerges. From T+30 onwards, candles return to normal size and the trend is tradable.

HOW A TRADER USES THIS (CONCRETE, DOLLARS-FIRST)

🟢 Pre-event (T-30 → T-0): Size at 60% of normal. Tighten exits.
🛑 T-0 chaos (T-0 → T+5): Stand aside. Do NOT trade.
🟢 Post-settle (T+5 → T+30): Re-read direction. Trade only the confirmed-candle-close direction.
🟢 Resume (T+30 onwards): Resume normal trading patterns.

💲 DOLLAR CONTEXT FOR EACH WINDOW

💲 Pre-event: $100 – $300 whips per 5m candle on $100k EURUSD.

💲 T-0 chaos: $500 – $1,000 swings in 60 seconds on $100k notional.

💲 Post-settle: $200 – $400 per 5m candle (settling).

💲 Resume: $50 – $150 per 5m candle (normal).

RENDERED ATLAS EVENT CARDS — NEXT EVOLUTION

Future scans will replace the prototype chart with live ATLAS chart snapshots taken during real announcements, with all four windows annotated on the actual price action.

▸ `Briefing summary`

One high-impact catalyst inside the window.
Risk state is 🟠🟠🟠🟠⚫ 4/5 — Elevated.

Concrete action:
① Cut all positions in affected pairs to 60% of normal size by T-5 of CPI (USD) (15:55 AWST · 07:55 UTC).
② Stand aside from T-0 to T+5 — the chaos window. Watch the 5-min candle close at T+5.
③ Re-read direction on the T+5 close against the 4 reaction paths above.
④ Trade only the post-settle direction at 60% size until the next scheduled catalyst delivers.
⑤ ATLAS Market Intel next tick updates at the next scheduled 5-minute interval.
