📰 MARKET INTEL ~ LIVE MACRO BRIEFING

1 major event landing in the next 6 hours.

Combined risk state: ●●●●● 3/5 — Active. See operational read below.

EXPANDED TERMINOLOGY HYPERLINKS

[CPI](#)] [Hawkish](#)] [Dovish](#)] [Risk-On](#) / [Risk-Off](#)] [Yield Spread](#)] [VIX](#)] [Expected D](#)

🌐 GLOBAL MARKET MOOD & RISK STATE

➤ Risk State · ●●●●● 3/5 ~ Active

What [Market Mood](#) means right now.

A single high-impact catalyst is in the window: CPI (USD) at 17:00 AWST · 09:00 UTC. Concentrated 30-minute risk envelope around the release.

What this means for trader behaviour today (dollars-first):

- Pre-event window — If your normal risk per trade is \$500 on a \$10,000 account, reduce to ~\$300 (60% of normal) for the next 6 hours. Why: bigger market swings mean wider exit-points are needed, which means more \$\$\$ at risk per setup.
- During CPI (USD) (09:00 UTC → T+5) — do NOT trade. Do NOT add to open positions. The first 60 seconds after the **announced result** routinely moves \$500–\$1,000 against any position on a standard \$100k EURUSD lot.
- After CPI (USD) (T+5 → next catalyst) — wait for the 5-min candle close at T+5 to read direction. Then re-size, still at 60% of normal until the next scheduled catalyst delivers.
- If multiple clustered events ALL surprise on the [hawkish](#) side: stand aside entirely for the rest of the session.

Why this rating, not lower or higher:

Rating would be ●●●●● 4/5 — ELEVATED if a second high-impact catalyst joined the window. Rating would be ●●●●● 2/5 — CALM if today were driver-led only.

📅 MAJOR EVENTS · NEXT 24 HOURS

09:00 UTC CPI (USD) (USD) ●●●●● 4/5 — HIGH

➤ Why these events matter (plain English)

Hotter-than-forecast readings historically tend to support USD and yields (rates expected to stay higher for longer), pressuring gold and risk indices. Cooler readings favour the reverse rotation.

ATLAS · Market Intel

📰 PRIMARY EVENT · CPI (USD) · 09:00 UTC

🇺🇸 · CPI (USD) · ● HIGH

Hotter-than-forecast readings historically tend to support USD and yields (rates expected to stay higher for longer), pressuring gold and risk indices. Cooler readings favour the reverse rotation.

WHEN Today · 09:00 UTC EVENT INTENSITY ●●●●● 4/5 — High

EXPECTED DURATION

Intraday (next 6 hours)

AFFECTED MARKETS

DXY · EURUSD · GBPUSD · USDJPY · USDCAD · USDFX · AUDUSD · NZDUSD · XAUUSD

💵 DOLLAR IMPACT RANGE

- 💵 Typical first-60-second swing range (scenario estimate basis — historical analogue cache not yet wired):
- 💵 \$500 – \$1,000 on \$100k EURUSD lot.
- 💵 \$1,200 – \$2,500 on 1 standard XAUUSD lot (100 oz).
- 💵 \$400 – \$900 on 100 shares US large-cap.
- 💵 \$600 – \$1,200 on \$100k USDJPY lot.
- 💵 \$300 – \$750 on NAS100 mini (per pt × 5).
- 💵 Median post-settle move: \$700 – \$1,500 trend move on \$100k EURUSD over the T+5 → T+90 window.

WHAT TRADERS SHOULD WATCH · PRE / DURING / POST

- BEFORE — Cut all dollar-pair positions to 60% of your normal trade size by 09:00 UTC – 5min. If your normal trade is 1 lot, begin at 0.6 lot (~\$300 risk instead of \$500). Why: pre-announcement volatility makes wider exit-points necessary, which means more \$\$\$ at risk per trade.
- DURING — Do NOT trade between 09:00 UTC and T+5. Do NOT add to open positions. The first 60 seconds is noise — the T+5 candle close shows the real direction.
- AFTER — Wait for the T+5 5-min candle close. Identify direction. Only re-enter on setups where price closes beyond the trigger level AND the next candle shows the real direction. (the **confirmed directional structure test**). Still at 60% size until the next scheduled catalyst delivers.

📰 REACTION PATHS · WHAT THE 4 OUTCOMES MEAN FOR YOU

🔴 POSSIBLE MARKET REACTION PATHS

[Hawkish](#)] [Dovish](#)] [In-Line](#)] [Initial-Direction Reversal](#)]

➤ IF HIGHER than forecast (hawkish-for-USD)

Affected markets: US Dollar Index · EURUSD · GBPUSD · USDJPY · XAUUSD · NAS100 · US500

Expected behaviour:

- US Dollar Index pushes higher — buyers pile into the dollar
 - USD pairs respond first on rate-path repricing
 - US indices (NAS100 / US500) drop on rate-hike fears
 - Gold initially drops; can recover on safe-haven flow if surprise extreme
- 💵 Dollar impact (first 30 minutes after the release):
- Long USD positions: **\$300 – \$800 gain**
 - Short USD positions: **\$300 – \$800 drawdown**
 - Long XAUUSD trades: **\$500 – \$1,500 drawdown**

What you should do:

- ✗ Do NOT enter fresh positions in the first 5 minutes — chase risk is high
 - ✗ Do NOT add to any positions against the surprise direction
 - ✓ After the 5-min close at T+5, look for SHORT positions in the dominant USD direction using the next Dark Horse scan
 - ✓ Exit losing positions against the surprise direction on the T+5 close if direction holds
- IF LOWER than forecast (dovish-for-USD)

Affected markets: US Dollar Index · EURUSD · GBPUSD · USDJPY · XAUUSD · NAS100 · US500

Expected behaviour:

- US Dollar Index pulls back — sellers exit dollar longs
 - USD pairs reverse on rate-path repricing
 - US indices rally on rate-cut optimism
 - Gold rises with broader risk-on flow
- 💵 Dollar impact (first 30 minutes after the release):
- Long USD positions: **\$300 – \$800 drawdown**
 - Short USD positions: **\$300 – \$800 gain**
 - Long XAUUSD trades: **\$500 – \$1,500 gain**

What you should do:

- ✗ Do NOT enter fresh positions in the first 5 minutes
 - ✗ Do NOT add to any positions against the surprise direction
 - ✓ After the 5-min close at T+5, look for LONG positions in the dominant opposite-USD direction using the next Dark Horse scan
 - ✓ Exit losing positions against the surprise direction on the T+5 close if direction holds
- IF IN-LINE with forecast / market pricing

Affected markets: light reaction across the board

Expected behaviour:

- Initial spike either side then settle. No clean directional bias.
 - Volatility drops within 15 minutes.
 - Markets refocus on the next scheduled catalyst.
- 💵 Dollar impact (first 30 minutes after the release):
- \$100k EURUSD position: \$100 – \$300 swings then mean-reversion

What you should do:

- ✗ Do NOT trade the initial spike — it will settle.
 - ✓ Stand aside through T+5. Re-read at next ATLAS scan.
 - ✓ Re-engage normally once the next scheduled catalyst delivers.
- IF INITIAL-DIRECTION REVERSAL · the first move reverses within 10 minutes

Affected markets: US Dollar Index · EURUSD · GBPUSD · USDJPY · XAUUSD · NAS100 · US500

Expected behaviour:

- The first direction off the release is faded by T+10.
 - Volume comes IN against the initial move.
 - The 15-min close at T+15 is the real trend, not the first 60-second spike.
 - Happens roughly 1 in 4 high-impact releases — more often in elevated-volatility regimes.
- 💵 Dollar impact (first 30 minutes after the release):
- Trades chasing the first 60 seconds (any direction): **\$800 – \$1,500 drawdown**

What you should do:

- ✗ Do NOT chase the first move under any circumstance.
- ✗ Do NOT add to positions on the initial direction inside T+10.
- ✓ Wait for the 15-min candle close at T+15.
- ✓ Trade only the post-T+15 direction — that is the actual signal.

ATLAS · Market Intel

📰 RISK ESCALATION · PRE / DURING / POST

⚠ RISK ESCALATION · TIME-WINDOWED BEHAVIOUR

[Risk Escalation](#)] [Stand Aside](#)] [Position Sizing](#)] [Volatility Window](#)]

- **HEALTHY · normal trade-management with one change**
Reduce all positions in affected pairs to 60% of normal size by T-5. Use it
💵 Cost of staying full-size into T-0: \$200 – \$400 extra drawdown on a \$10
Action: Tighten exits. Close losers. Cut size to 60%.
- **CAUTION · final lead-in**
Close any open positions UNLESS they are >1.5R in profit AND your exit is
💵 Open positions face \$500 – \$1,000 first-minute swing risk on \$100k notional
Action: Tighten exits to break-even or step aside.
- **DANGER · the release moment**
Markets routinely whip \$500 – \$1,000 against any position on \$100k notional
💵 \$500 – \$1,200 first-60s swing risk on \$100k notional.
Action: Stand aside. Watch the 5-min candle close. Do NOT trade.
- **STAND ASIDE · if a clustered catalyst chain emerges**
If this release combines with another high-impact event inside the same session
💵 \$1,500 – \$3,000 combined-window move on \$100k notional.
Action: Wait for the 15-min close AFTER the FINAL catalyst before resuming
- **RE-ENTRY · post-settle resumption**
Re-read structure on the 5m chart. Match against the reaction paths. Act on
💵 Continued 60% size until the next scheduled catalyst delivers; resume normal
Action: Trade only confirmed-candle-close direction at 60% size.

➤ What changes this risk state

- If a central-bank rate decision is added: state climbs to ●●●●● 5/5 — EXTREME.
- If any scheduled high-impact event cancels: state drops one tier.
- If geopolitical risk escalates inside the session: state climbs one tier (safe-haven rotation overrides driver-led tape).
- If yield curve un-flattens beyond 0.60: cyclical rotation re-prices — direction read flips.

📰 WHAT TO WATCH · PRE / DURING / POST CPI (USD)

🔍 WHAT TRADERS SHOULD WATCH (each row carries action)

[DXY](#)] [Yield Spread](#)] [VIX](#)] [Liquidity](#)] [Hawkish](#)] [Front-End Yields](#)]

➤ Pre-event indicators (now → T-5)

US Dollar Index above 105 — The dollar has ALREADY moved up in anticipation of a hawkish read. Action: do NOT bet on further dollar strength unless the release surprises EVEN HOTTER than expected. The easy long-dollar trade is already priced in.

Front-end yields above 4.85% — The bond market is also already positioned for a hawkish reading. Same as DXY above — be cautious of fresh long-dollar entries.

CBOE Volatility Index above 18 — Traders are nervous about the release. Equity downside risk is elevated. Do NOT take fresh long-equity positions before T-0.

CBOE Volatility Index below 14 — Traders are complacent. A surprise reading will hit harder. Avoid new positions in any market until T+5.

USD pair at the high or low of its 24h range entering T-0 — The market is leaning directionally. A surprise against that leaning causes the BIGGEST whips. Cut size further if the lead pair is at an extreme entering T-0.

➤ During the event (T-0 → T+5)

The first 60 seconds of price action — It is NOISE. Do not act on it.
Action: [Stand aside](#).

The 5-min candle CLOSE at T+5 — That prints the real direction. Read US Dollar Index first, THEN look at USD / XAUUSD response.
Action: [Wait for the close](#). [Read DXY first](#).

➤ Post-event reassessment (T+5 onwards)

Did the initial direction HOLD or REVERSE inside 10 minutes? — If reversed: trade only the post-T+15 direction. The initial move was wrong.

Is volume CONFIRMING the move or FADING? — Confirming = sustained large candle bodies in the direction. Fading = candle bodies shrinking — direction is exhausting. Only enter trades when volume is confirming.

What did treasuries do? — Bonds move opposite to yields. If yields jumped, bonds fell — that confirms a HAWKISH read. Trade in line with bonds for the cleanest signal.

Next scheduled catalyst proximity — If another high-impact catalyst is within 2 hours, small size or stand aside through the inter-catalyst window.

ATLAS · Market Intel

📰 EVENT-DAY REFERENCE · THE 4 WINDOWS

🕒 EVENT-DAY REFERENCE · THE 4 WINDOWS

📰 How to read an event-day chart

Before the release, candles are small and quiet (pre-event window). At T-0 the candle range explodes — that is the chaos window. By T+5 the noise settles and a clear direction emerges. From T+30 onwards, candles return to normal size and the trend is tradable.

THE STORY

Before the release, candles are small and quiet (pre-event window). At T-0 the candle range explodes — that is the chaos window. By T+5 the noise settles and a clear direction emerges. From T+30 onwards, candles return to normal size and the trend is tradable.

HOW A TRADER USES THIS (CONCRETE, DOLLARS-FIRST)

- Pre-event (T-30 → T-0): Size at 60% of normal. Tighten exits.
 - T-0 chaos (T-0 → T+5): Stand aside. Do NOT trade.
 - Post-settle (T+5 → T+30): Re-read direction. Trade only the confirmed-candle-close direction.
 - Resume (T+30 onwards): Resume normal trading patterns.
- 💵 DOLLAR CONTEXT FOR EACH WINDOW
- 💵 Pre-event: \$100 – \$300 whips per 5m candle on \$100k EURUSD.
 - 💵 T-0 chaos: \$500 – \$1,000 swings in 60 seconds on \$100k notional.
 - 💵 Post-settle: \$200 – \$400 per 5m candle (settling).
 - 💵 Resume: \$50 – \$150 per 5m candle (normal).

RENDERED ATLAS EVENT CARDS — NEXT EVOLUTION

Future scans will replace the prototype chart with live ATLAS chart snapshots taken during real announcements, with all four windows annotated on the actual price action.

➤ Briefing summary

One high-impact catalyst inside the window.

Risk state is ●●●●● 4/5 — Elevated.

Concrete action:

- _① Cut all positions in affected pairs to 60% of normal size by T-5 of CPI (USD) (17:00 AWST · 09:00 UTC)._
- _② Stand aside from T-0 to T+5 — the chaos window. Watch the 5-min candle close at T+5._
- _③ Re-read direction on the T+5 close against the 4 reaction paths above._
- _④ Trade only the post-settle direction at 60% size until the next scheduled catalyst delivers._
- _⑤ ATLAS Market Intel next tick updates at the next scheduled 5-minute interval._
